AutoCAD LT, CADER is a different CAD program and there are many different programs using this file format. Since version 2016, the Autodesk DWG, Drawing exchange format file can be exported as Xref, meaning the file can be opened in other programs. Support Licensing AutoCAD LT is only sold under Microsoft's "under the Windows 10 Academic Benefit license" program; this means that it is only sold directly through Microsoft, and not through commercial distribution such as resellers, third-party distributors, or the like. AutoCAD LT may be purchased directly from Microsoft for use on up to five computers at one location. Additional licenses are available for use on additional computers. Licenses are sold on a yearly basis. It may be purchased for up to one computer, if the software is to be used at a single location. A computer is defined as a single workstation, a server or other computer with multiple processors. In this case, the number of software licenses are based on the number of processors in the workstation. Where two computers are running the same version of AutoCAD LT, it is possible to run separate instances of the application on each workstation. This approach allows those applications to continue using the native file formats of AutoCAD and other native AutoCAD applications without interfering with one another. Autodesk LT, which is a part of the AutoCAD family, is also available for purchase directly from Autodesk as well. The product is the same as the AutoCAD LT available through Microsoft's academic pricing program, but sold directly from Autodesk. Field of the Invention The present invention relates to the rendering of surfaces. More specifically, the invention relates to rendering surfaces with a number of transparent surfaces and generating lighting therefrom. 2. Description of the Related Art Rendering is the process of converting 3D models, represented by a number of polygons, into a real 3D image. Rendering includes lighting calculations which may involve the application of lighting model, such as a Phong or Lambert model, to each polygon. The most common method for rendering realistic images is to model the environment with polygons and then render the scene with lighting. The main problem
