

May 4, 2564 B.C. - Quick answer: Laser printers use an electrical charge to attract toner particles to the transfer roller. The toner particles are pressed against the product. When the transfer roller moves, the toner sticks to it. When the roller moves back, the toner bounces off of it again. After each pass, the laser prints new barcodes on the sheet. This means that the transfer rollers need to be replaced. Refilling a laser printer is more than just replacing the transfer rollers. Usually you need to change the toner in the cartridge. Toner is not just a powder, it is a very small diamond that adheres to the surface of the transfer roller
