source code in ASCII text. Several key aspects of AutoCAD's programming model are described in the Model Driven Architecture (MDA). Code AutoCAD uses object-oriented programming and uses standard object-oriented programming languages such as C++ and Delphi as its main programming language. The objects/classes in AutoCAD are similar in concept to the objects/classes in most other programming languages. Methods In AutoCAD, methods are objects/functions that you call, much like procedures and functions in other programming languages. When you draw a function, the option to Create Function appears in the command line interface. On the right side of the command line are the parameters of the function, separated by commas. Each parameter has a name (text), a data type (text), a default value (default text), and a description (text). The data type and default value are mandatory. You must also enter the name of the variable that will hold the function result. The data type should be one of the following: floating point numbers, decimal numbers, or boolean. If the data type is boolean, only one of the two true and false keywords can be used. The default value is optional. Below are some sample statements: SELECT METHOD; Creates a user-defined function. SELECT METHOD; 1, FALSE, "Description of this function." TRUE Declares the function with two parameters and assigns them to variables. ASSIGN METHOD; "Function of Name" "" F; Calls the function. When you call the function, any variables you have declared are passed to the function's parameters. DELETE METHOD; Deletes the function from the drawing. CREATE METHOD "myFunction" TRUE M; This example uses the default object name. If you use your own object name, then the object name must be preceded by a space character. Filtering Some objects and methods have optional filters applied by default. For example, a solids tool only shows objects that have a solids flag set. You can set or unset a filter for an object/method before you create the object. SET FILTER; OBJID 2035 USERID 0 TRUE C; When af5dca3d97
