This case report focuses on the clinical presentation and medical management of mandibular osteomyelitis. A review of the medical literature was performed to examine the pathophysiology, diagnosis, and treatment of this condition. The patient, a 6-year-old female, was initially diagnosed with right side mandibular osteomyelitis in the primary care setting. She was treated initially with surgical debridement and intravenous antibiotics. Unfortunately, her infection recurred after 2 months, and her oral health was compromised during the recurrence. She was referred to a specialist for treatment. The patient was then treated with a combination of intravenous and oral antibiotics for 2

years. During this time, she was followed clinically and radiographically for persistent infection. The results of the histopathologic examination of her biopsy specimen were compatible with a diagnosis of osteomyelitis. This case report illustrates the diagnosis and treatment of mandibular osteomyelitis in a pediatric patient.
